

INVENTORY MANAGEMENT SYSTEM

PROBLEM STATEMENT

The problem faced by the company is that they do not have any systematic system to record and keep its inventory data. It is difficult for the admin to record the inventory data quickly and safely because they only keep it in the logbook and are not adequately organized.

Every inventory stock manager's main problem is keeping track of how much stock is purchased and how much stock is spent. The stock admin does not have an easy way to manage and see stocks purchased and dispatched in the organization.

At present, this is done where the manager has to manually keep the reports in hand and calculate the costs eventually. The organization admin does not have an easy way to look at the details and the amount of stock being purchased and dispatched. The cost spent on the food items is also unknown to the college admins.

Usually, Inventory Management systems are limited and fixed to a selected range of items and cannot be modified and extended based on the customer's needs.

The Inventory Management System focuses on making it expandable and usable easily by the end user and with constant customer support to alter the use.

Interface as needed; separate login credentials are provided for the manager to insert and manage the stock and view the same.

Unlike other software that provides similar functionalities, Inventory Management System focuses on making it easier by adding additional functionalities like vendor details and allowing to take attendance and keep a count of several members belonging to that organization.
