

## IBM Cloud Object Storage System

Components that are simple to manage and flexible to deploy

### Manager

- Fault management
- Reporting
- Provisioning
- Performance monitoring
- Storage configuration
- Single pane of glass

### IBM Accesser\*

- S3 interface
- Encrypts data
- Slices data
- Disperses data
- Retrieves data
- Stateless

### IBM Slicestor\*

- Storage for slices
- Single site or multi-site
- Capacity-based pricing
- Data integrity management

Supported as an IBM appliance

Supported as Software Defined Storage (SDS)

IBM

Cisco, Dell EMC, HPE, Lenovo, Supermicro

Easy to certify new models as a supported IBM configuration

## Access Management

IBM® Cloud Identity & Access Management (IAM) enables you to securely authenticate users and control access to all cloud resources consistently in the IBM Cloud Platform.

Invite Users

Create credential

### Identity and Access Management

The concept of access management in IBM Cloud consists of a few interrelated components, including users, resources, policies, roles, actions, and the Cloud IAM control system, which allow users to take actions on resources within an account.

[Learn more](#)

#### Users

All users are identified by their IBMid.

#### Service IDs

Service IDs are the Cloud IAM feature that is used to provide a separate identity for services and applications. You can create a service ID to be used by an application that needs access to your IBM Cloud services so that individual user credentials do not have to be used.

#### Cloud Resource Name (CRN)

Exist exclusively within an IBM Cloud Service Instance. In a Cloud Object Storage instance, a bucket is a resource.

### Access at the Instance level

Using IAM you can manage access at the IBM® Cloud Object Storage service instance, where a user or Service ID can have access to buckets in the instance.

### Access at the bucket level

Using IAM you can manage access at the bucket level, where a user or Service ID can have access to bucket only
